(a) disagreement with the translate
share of cells that disagree
M (translation by $2^M e_x$, torus index 8^M)
measured, level-6 patch
proved bound $c(M)/8^M$
$28 \cdot 4^{-M}$
reference level, not a series:
Hat, best non-identity
translate at 4 steps
(Part VII, other footing)
(b) how nearly the translate $(v_x, v_y, 0)$ is a period
v_y
v_x
level-5 patch; blank = no agreement, or overlap under 1/8
$-\log_{10}$(share that disagree); 2 = 99% agree
(c) near-periods are 2^M-divisible
number of translates
2-adic valuation of the translation vector
agreement ≥ 0.5
agreement ≥ 0.9
agreement ≥ 0.99
(d) the undetermined set has dimension 1
addresses in the 2^M cube
M
all addresses, 8^M
label excess $E(M) = 140 \cdot 2^M + 48$
undetermined $c(M) = 28 \cdot 2^M - 48$
